Transfusion Medicine, Apheresis, and Hemostasis: Review Questions and Case Studies is the collaborative effort that spanned a time period of 2 years and included 50 experts, many whom are national leaders in their respected fields. It also represents the passion and privilege we feel to teach the next generation of physicians in Transfusion Medicine and Apheresis. The main goal for this book is to help the readers build a solid foundation of both basic and advanced conceptual knowledge to prepare for the American Board of Pathology (ABP) certification exam in Transfusion Medicine. This book is not intended to be a substitute
for textbooks, original research or review articles, and/or clinical training. Further, since the field of medicine, both from a scientific and regulatory perspective, rapidly changes, the readers are advised to continuously update their knowledge by attending national meetings and reading clinical journals. To equip the readers with the basic knowledge in critical reading and data analysis, which is an essential skill in daily medical practice, a novel chapter titled “Data Interpretation in Laboratory Medicine” was included in this book. In this chapter, the readers are asked to make logical conclusions based on the given data and/or statistical results. Moreover, there is also a chapter on “Practical Calculations in Transfusion Medicine, Apheresis, and Hemostasis” to help consolidate all the necessary formulas commonly used in daily practice for easy reference. These chapters are unique to our book and will not be found in any other currently on the market. All of the questions in this book were originally created by the authors of each chapter. Each question can either be standalone or part of a case scenario representing challenge cases in Transfusion Medicine, Apheresis, and Hemostasis. These questions often represent both rare and common clinical scenarios that the authors have seen during their clinical practice. Each question is then followed by 5 possible answers, with only one being correct (or the best answer). After the question, there is a conceptual explanation followed by a more factual explanation of the right and wrong answers. We gave the individual authors the freedom to choose how they explained the wrong answer choices. Some authors chose to be more direct (e.g. Answer A is incorrect because), while other authors chose a more conversational style (e.g. Human resources (answer A) includes staffing, selection, orientation, training, and competency assessment of employees). This format is designed to help the student linking the conceptual and factual knowledge together to form a solid foundation for use in clinical practice. At the end of each chapter, there is a list of articles and textbooks that will prove useful to the motivated student who wishes to become an expert in the field. Another special feature to our textbook is the presence of a pre-test and post-test, which are provided to help the readers with self-assessment. As stated above, the main focus of this book is to help the readers preparing for the ABP certification exam in Transfusion Medicine. However, due to the interdisciplinary nature of the field of Transfusion Medicine, Apheresis, and Hemostasis, we believe that this book is also beneficial to and can be used by all clinicians involved in the management of complex transfusion, apheresis, and hemostasis issues, such as hematologists, anesthesiologists, surgeons, and critical care physicians. We further believe that it is a helpful guide for these specialists to prepare for their own specialty certification exam, when the topics are related to Transfusion Medicine, Apheresis, and Hemostasis.

Clinical Laboratory Hematology

There have been many changes in the field of coagulation during the past decade. New concepts of epidemiology of risk factors for thrombosis now help clinicians predict who is more likely to form clots after surgery, or after being placed on oral contraceptives. New anticoagulants have the potential to redefine how patients with atrial fibrillation and venous thrombosis are managed. There are new forms of recombinant clotting factors which have changed our approach to hypofibrinogenemia and von Willebrand’s disease. Newer antiplatelet agents are available and their use in patients receiving cardiac stents has mushroomed. The management of thrombosis in the setting of pregnancy has changed over the past decade, as well as the way clinicians approach women with multiple miscarriages. An entire new class of compounds, the thrombopoietins, are available to treat individuals with immune thrombocytopenic purpura (ITP). The Coagulation Consult covers major topics of interest to hematologists who are asked to consult on individuals with coagulation related diseases, and encompasses the field’s most recent developments. This “case-directed” book describes state-of-the-art approaches to patients with bleeding and clotting disorders, as well as laboratory tests for coagulation. Chapters include different vignettes, focus on typical clinical consult questions, and lay out specific types of treatment. Practicing clinicians being confronted with coagulation consult students, residents, fellows and attending physicians will find this unique text an invaluable resource for some of the newer areas of coagulation science, therapy and pharmacology.

"Over the last decades, major progress has been made in quality assurance of hemostatic laboratory assays. This book will be an indispensable part of every hemostasis laboratory, where, given its hands-on nature, it will rarely sit to get dusty on the shelves." — Frits R. Rosendaal, Leiden University Medical Center

The hemostasis laboratory has a vital role in the diagnosis and management of patients with familial and acquired hemorrhagic and thrombotic disorders. Its role in the monitoring traditional anticoagulant therapy as well as therapy using new anticoagulants presents new challenges to the laboratory. Quality in Laboratory Hemostasis and Thrombosis not only addresses these important issues, but also covers international guidelines for testing, the development of international standard materials, management of hemostasis testing from the laboratory to the point of care as well as molecular genetic testing. Designed as a guide for all those working in hemostasis laboratories, this book details a quality program that, when put into place, will help to improve standards in testing. All of the authors are internationally recognised for their work in hemostasis and thrombosis. Using their experience, they provide information on standards, equipment and methods that will guide the development of a quality program to support all activities in the hemostasis laboratory.
